

Minutes of Meeting (MoM) (3)

Team: 35

Project: Cross-Channel Customer Interest & Engagement Intelligence System

Client: Club Artizen

Date: 05-02-26

Online Meet

Objectives

- Discuss the draft requirements engineering document formulated based on initial requirements list proposed by the client, which included notes on feasibility and analysis under the MoSCoW model.
- Seek detailed clarifications and validate suggestions/modifications to the requirements list in order to achieve greater clarity about functional and non-functional requirements.
- Share the app prototype (mockup of the UI) designed using Figma with the client to collect high-level feedback and validate user stories.

Client Feedback

- Users must be able to rearrange widgets as required on the dashboard (similar to mobile home screens).
 - *Technical Note: The feasibility and complexity of this implementation need to be assessed by the team.*
- Widgets must be adaptable and highly customisable; should be able to add/remove widgets as required. If a specific platform (e.g., WhatsApp) requires reduced activity due to constraints like blacklisting, the system should allow swapping the corresponding widget with those for alternative platforms.

- Require specific widgets on the main dashboard for various social media platforms, which can be clicked to open up a detailed platform view with analytics.

Clarifications

- For email campaigns, Zoho and HubSpot are the designated tools for mailing integrations. However, the client is open to suggestions regarding suitable mailing tools to best fit their requirements, since they do not currently run email campaigns and plan to start it as a new marketing venture.
- Resolved doubts about paid vs. organic posts. Paid posts entail boosting of posted content broadly across all accounts via payment, whereas organic posts are regular posts that gain traction organically. Campaigns are targeted initiatives focused on specific audiences rather than general boosting.
- Database should store at least the past 1 year's worth of comment and post data, to support analytics about seasonal trends.

Action Items

- Evaluate feasibility of sourcing competitor data by examining what sorts of data can be fetched about competitor businesses from publicly available information (would require some scraping of relevant websites).
 - Inform the client about the feasibility soon so as to scope the project accordingly.
- Engagement Metrics: Research further on how we can accurately detect and quantify a drop in engagement?
 - *Note: This is a critical requirement for the client and needs a defined logic.*
